

How to Merge Split Video Files

Notice

Due to a bug I didn't catch in my program until about 40% of the way through my Filester migration (~2TB of data, alphabetically from 18VR to VirtualPapi videos) there will be a slight jump in the merged video where the splice occurred. There is not much I can do about this for the time being. I will go back and reupload proper versions of most/all of the videos when the migration is finished, however it will take a while due to having to reprocess hundreds of videos I have already moved.

GUI Method

1. Install [MKVToolNix](#)
2. Drag your files into the input sources section and hit `ok`
 - Make sure videos are in the correct order to be merged
3. Hit `Start multiplexing` and it should finish in a minute or so
 - This is just merging, not re-encoding, so it's mostly reliant on your disk speed

Command Line Method

```
ffmpeg -f concat -safe 0 -i "concat:Part1.mkv|Part2.mkv|Part3.mkv" -c copy Final.mkv
```
